Mobile & desktop.

# 6강. 서비스 및 모듈

#### **DEVELOP ACROSS ALL PLATFORMS**

Learn one way to build applications with Angular and reuse your code and abilities to build apps for any deployment target. For web, mobile web, native mobile and native desktop.

06 강.

서비스 (service) 및 모듈 (module)

#### □ 1) 서비스 개요

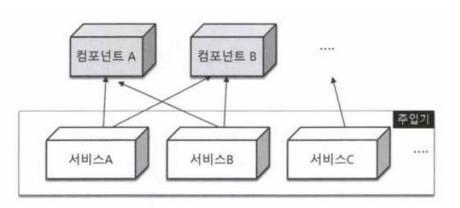

### \* 서비스 개요

- -Angular에서 서비스는 외부에 정의된 의존성 주입 대상이 되는 싱글톤 클래스로서 @Injectable() 을 사용하여 정의한다.
- -컴포넌트에서 사용하기 위해서는 providers 속성에 선언되어야 한다.
- -뷰와 관련된 로직만 component 로 만들고 다른 모든 로직은 서비스로 구현한다.

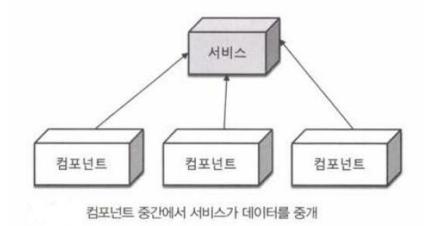

#### \* 서비스 역할

가. 관심사의 분리 (AOP: Aspect Oriented Programming)

관심사에 따라 컴포넌트에 다르게 주입되는 서비스

나. 컴포넌트 중간에서 데이터 중개자의 역할

# 1) 서비스를 생성한다.

```
Service

ng g service MyService // Creates MyService
```

```
my-app > src > app > TS hello.service.ts > ...

1   import { Injectable } from '@angular/core';

2   3   @Injectable({
   4   | providedIn: 'root'
   5   })
   6   export class HelloService {
   7   |
   8   | constructor() { }
   9  }
```

C:\angular\my-app>ng g service hello
CREATE src/app/hello.service.spec.ts (352 bytes)
CREATE src/app/hello.service.ts (134 bytes)

```
TS app-routing.module.ts
# app.component.css
app.component.html
TS app.component.spec.ts
TS app.component.ts
TS app.module.ts
TS hello.service.spec.ts
U
TS hello.service.ts
```

# 2) 컴포넌트의 공통 기능 메서드 구현

"Hello 서비스" 문자열을 반환 해주는 공통 기능의 sayHello() 메서드를 추가한다.

```
hello.service.ts X
y-app > src > app > TS hello.service.ts > ...
     import { Injectable } from '@angular/core';
 2
     @Injectable({
       providedIn: 'root'
 4
 5
     export class HelloService {
 6
 7
 8
       constructor() { }
 9
        //공통 기능 구현
10
11
        sayHello():string{
          return "Hello 서비스";
12
13
14
```

# 3) 서비스 등록

서비스를 사용하기 위해서 컴포넌트에 providers 속성으로 등록한다

```
app.component.ts ×
y-app > src > app > TS app.component.ts > ...
     import { Component } from '@angular/core';
     import { HelloService } from './hello.service';
     @Component({
        selector: 'app-root',
       templateUrl: './app.component.html',
        styleUrls: ['./app.component.css'],
       providers:[HelloService]
10
     export class AppComponent {
11
12
       title = 'my-app';
13
```

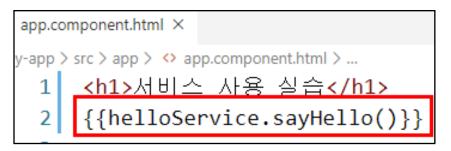

4) 의존성 주입 (Dependency Injection: DI)

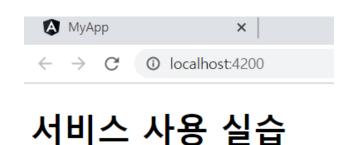

컴포넌트 클래스의 <u>생성자</u>를 사용하여 Hello서비스를 의존성 주입(DI) 받는다.

```
export class AppComponent {
   title = 'my-app';

   //생성자를 이용한 의존성 주입
   constructor(public helloService:HelloService){}
}
```

# 5) 서비스 호출

Hello 서비스

# □ 서비스의 생성

```
✓ src
✓ app
TS app-routing.module.ts
# app.component.css
◇ app.component.html
TS app.component.spec.ts
TS app.component.ts
TS app.module.ts
TS hello.service.spec.ts
U
TS hello.service.ts
```

```
C:\angular_chul\chul-app>ng g serivce hello

An unhandled exception occurred: Schematic "serivce

See "C:\Users\ledzep\AppData\Local\Temp\ng-G37kdv\a

C:\angular_chul\chul-app>ng g service hello

CREATE src/app/hello.service.spec.ts (352 bytes)

CREATE src/app/hello.service.ts (134 bytes)

C:\angular_chul\chul-app>

C:\angular_chul\chul-app>
```

```
TS hello.service.ts X
src > app > TS hello.service.ts > 😫 HelloService > 🏵 sayHello
       import { Injectable } from '@angular/core';
   2
       @Injectable({
         providedIn: 'root'
       export class HelloService {
         constructor() { }
   8
         //공통기능 구현
   9
         sayHello():string{
  10
            return "Hello 서비스";
  11
  12
  13
```

#### □ 서비스의 등록

App.component.ts에서 사용하기 HelloService등록

```
TS app.component.ts ×
                   TS hello.service.ts
src > app > TS app.component.ts > 😭 AppComponent
       import { HelloService } from './hello.service';
       @Component({
         selector: 'app-root',
                                                  @Component({
         templateUrl: './app.component.html',
   6
                                                    selector: 'app-root',
   7
         styleUrls: ['./app.component.css'],
         providers: [HelloService]
                                                    templateUrl: './app.component.html',
                                                    styleUrls: ['./app.component.css'],
       export class AppComponent {
  10
                                                    providers: [HelloService]
         title = 'chul-app';
  11
  12
  13
                                                  export class AppComponent {
                                                    title = 'chul-app';
app.component.html ×
                       TS app.component.ts
                                                    //생성자를 통한 의존성 주입
src > app > \ app.component.html > ...
                                                    constructor(helloService:HelloService){}
       <h1>서비스 사용의 실습</h1>
       {{helloService.sayHello()}}
```

# □ 자식컴포넌트에서 service생성

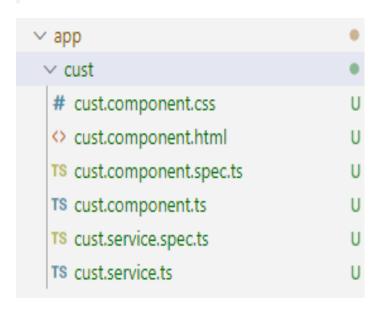

#### Ng g component cust 후 cust폴더에서 서비스 생성

C:\angular\_chul\chul-app\src\app\cust>ng g service cust

CREATE src/app/cust/cust.service.spec.ts (347 bytes)

CREATE src/app/cust/cust.service.ts (133 bytes)

```
실행(R) 터미널(T) 도움말(H)
                                             cust.service.ts - ch
TS cust.service.ts X
src > app > cust > TS cust.service.ts > 😝 CustService > \beta currentDate
       import { Injectable } from '@angular/core';
   2
       @Injectable({
         providedIn: 'root'
   5
       export class CustService {
         constructor() { }
   8
         //CustService의 역할은 현재 날짜 정보를 반환
   9
          currentDate(){
  10
            return new Date();
  11
  12
  13
```

#### □ 모듈에 service등록

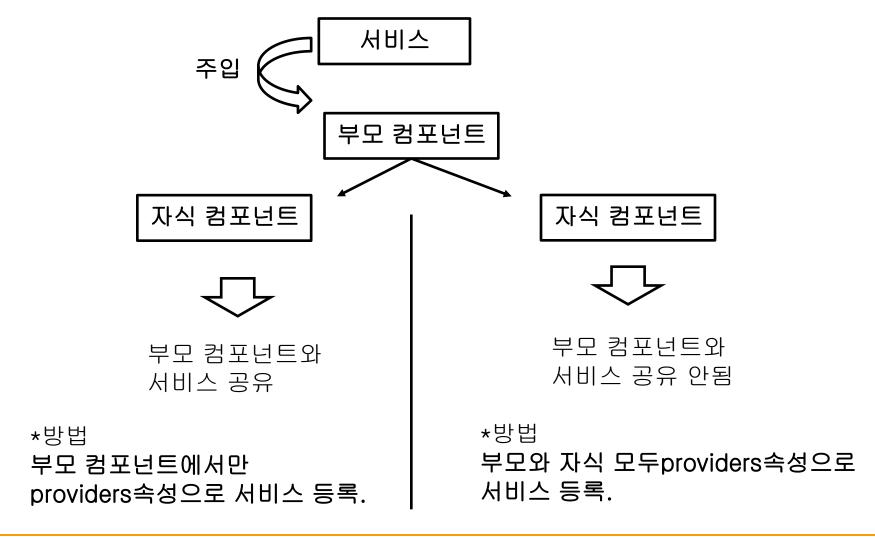

```
TS cust.component.ts X
src > app > cust > TS cust.component.ts > 含 CustComponent
       import { Component, OnInit } from '@angular/core';
       import {CustService} from './cust.service'
       @Component({
        selector: 'app-cust',
        templateUrl: './cust.component.html',
        styleUrls: ['./cust.component.css'],
        providers:[CustService]//서비스 등록
       export class CustComponent implements OnInit {
        //생성자를 통해 자동주입
 11
 12
         constructor(public custService:CustService) { }
         getCurrentDate():Date{
 13
          return this.custService.currentDate();
 14
 15
```

```
src > app > cust > ↔ cust.component.html > ...

1 <h1>모듈실습</h1>
2 현재시간 {{getcurrentDate()}}
```

중첩 컴포넌트인 경우 부모와 자식 컴포넌트에서 서비스를 공유해서 사용 가능.

```

#### □ 실습 문제 1

다양한 언어로 아침인사를 반환하는 서비스를 구현 하시오.

- 컴포넌트에서 국가별 코드를 선택하여 서비스에 전달한다.
- 서비스에서 국가별 코드에 따라서 반환되는 아침인사가 달라진다.

| 국가별 코드 | 아침인사말            |
|--------|------------------|
| KR     | 안녕하세요. 좋은 아침입니다. |
| US     | Good Morning     |
| CN     | 짜오 안             |
| JP     | 오하요~ 고자이마스       |

#### □ 실습1

```
C:\angular_chul\chul-app>ng g service morning
CREATE src/app/morning.service.spec.ts (362 bytes)
CREATE src/app/morning.service.ts (136 bytes)
```

```
export class MorningService {
 constructor() { }
 //code입력 받고 인사말 반환
 morning(code:string):string{
   var mesg="";
   if(code=="KR"){
     mesg="안녕하세요. 좋은 아침입니다.
   }else if(code=="US"){
     mesg="Good Morning";
   }else if(code=="CN"){
     mesg="짜오안";
   }else{
     mesg="오하이요 고자이마스 ~";
   return mesg;
```

```
@Component({
  selector: 'app-root',
 templateUrl: './app.component.html',
 styleUrls: ['./app.component.css'],
 providers:[MorningService] //서비스 등록
export class AppComponent {
 title = 'chul-app';
 //주입
 constructor(public service:MorningService){}
 mesg="";
 //1.MorningService생성
 //2.코드를 받아서 인사말을 반환하는 메서드 작성 : morning(){}
 handleEvent(code:string){
   this.mesg= this.service.morning(code);
                 <select (change)="handleEvent(kkk.value)" #kkk>
                   <option>KR</option>
                   <option>US</option>
                   <option>CN</option>
                   <option>JP</option>
                 </select><br>
```

인사말 : {{mesg}}

# □ 실습 문제 2

# 도서목록 데이터를 서비스에 저장하고, 컴포넌트에서 주입(injection) 받아서 데이터를 출력하는 어플리케이션을 구현 하시오.

```
book.service.ts X
ky > src > app > book > TS book.service.ts > ...
     import { Injectable } from '@angular/core';
     import { Book } from './book';
 3

# □ 4) 모듈이란?

# \* 모듈 ( module )

- -Angular는 특정 범주의 각 기능들을 묶어서 관리할 수 있도록 모듈(module) 기능 제공.
- -**모듈을 사용하면 그룹별 관리가 가능**, 그룹 내에서 공동으로 사용할 수 있는 기능추가 가능.
- -기본적으로 제공되는 app.module.ts 파일이 애플리케이션의 루트 모듈이다.

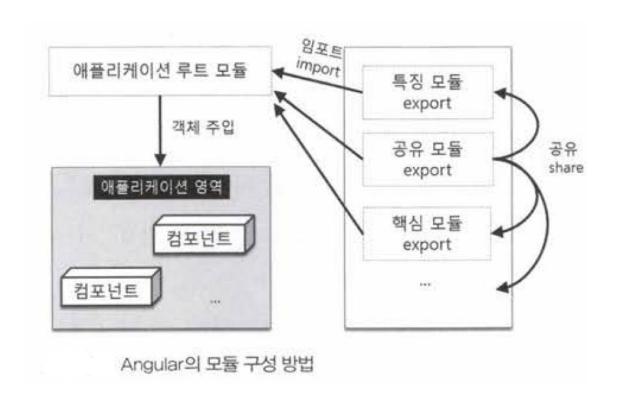

#### Angular 라이브러리 모듈

| 모듈 패키지명                   | 요약   |
|---------------------------|--|
| @angular/common           | 파이프, 구조 지시자, 속성 지시자와 관련된 모듈을 포함합니다.                  |
| @angular/core             | Angular를 구성하는 주요 요소의 장식자 및 핵심 모듈을 포함합니다.             |
| @angular/forms            | 폼 관련 모듈이나 지시자를 포함합니다.                                |
| @angular/http             | HTTP 통신과 관련된 모듈을 포함합니다.                              |
| @angular/platform-browser | 브라우저 모듈, DOM 새니타이저(sanitizer) 등 브라우저와 관련된 모듈을 포함합니다. |
| @angular/router           | 라우터 관련 모듈이나 지시자를 포함합니다.                              |
| @angular/testing          | 테스팅 관련 모듈을 포함합니다.                                    |

# □ 5) 모듈 구성 방법

# \* 모듈 구성 방법과 애플리케이션 루트 모듈

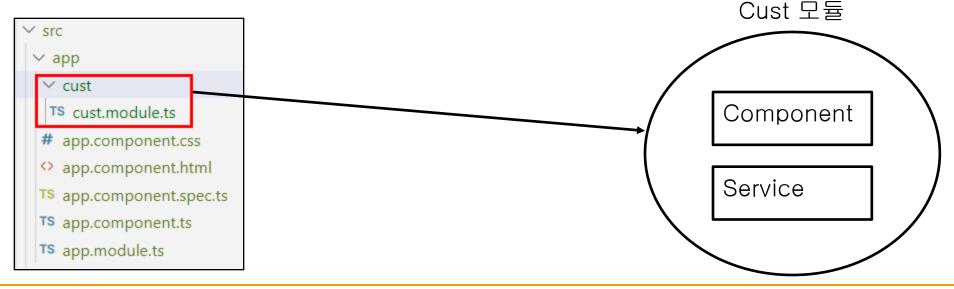

\* 새로운 모듈 생성 방법

```
C:\angular_chul\chul-app>ng g module Cust
CREATE src/app/cust/cust.module.ts (190 bytes)
C:\angular_chul\chul-app>[
```

1. 사용자 모듈을 생성한다. (예: 고객관리 목적의 cust 모듈)

C:\angular\my-app>ng g module Cust
CREATE src/app/cust/cust.module.ts (190 bytes)

C:\angular\my-app>ng g module Cust
CREATE src/app/cust/cust.module.ts (190 bytes)

#### 2. 생성된 cust 모듈에 필요한 컴포넌트와 서비스를 추가한다.

C:\angular\my-app>ng g component Cust

CREATE src/app/cust/cust.component.html (19 bytes)

CREATE src/app/cust/cust.component.spec.ts (614 bytes)

CREATE src/app/cust/cust.component.ts (267 bytes)

CREATE src/app/cust/cust.component.css (0 bytes)

UPDATE src/app/Cust/cust.module.ts (259 bytes)

C:\angular\my-app>cd src/app/cust

C:\angular\my-app\src\app\cust>ng g service Cust

CREATE src/app/cust/cust.service.spec.ts (347 bytes)

CREATE src/app/cust/cust.service.ts (133 bytes)

∨ app ✓ cust # cust.component.css cust.component.html TS cust.component.spec.ts TS cust.component.ts TS cust.module.ts TS cust.service.spec.ts TS cust.service.ts # app.component.css app.component.html TS app.component.spec.ts TS app.component.ts TS app.module.ts

#### 3. 컴포넌트와 서비스를 구현한다.

```
cust.service.ts X
r-app > src > app > cust > TS cust.service.ts > ...
     import { Injectable } from
 2
 3
     @Injectable({
 4
        providedIn: 'root'
     export class CustService {
 6
 7
        constructor() { }
 8
10
        currentDate(){
11
          return new Date();
12
13
```

```
cust.component.ts ×
-app > src > app > cust > TS cust.component.ts > ...
    import { Component, OnInit } from '@angular/core';
    import {CustService} from './cust.service';
 3
    @Component({
       selector: 'app-cust',
       templateUrl: './cust.component.html',
       styleUrls: ['./cust.component.css'],
       providers:[CustService]
     export class CustComponent{
10
11
       constructor(public custService:CustService) {
13
14
       getMesg(){
         return this.custService.currentDate();
15
16
```

4. 컴포넌트를 cust 모듈에 등록하고 exports 한다.

Cust 컴포넌트를 app.module.ts 파일인 애플리케이션 루트 모듈이 아닌 사용자가 정의한 cust.module.ts 파일에 등록한다.

외부 모듈에서 CustComponent를 사용하기 위하여 반드시 exports로 처리한다.

```
TS cust.module.ts ×

src_6강_모듈1 > app > cust > TS cust.module.ts > % CustModule

1 import { NgModule } from '@angular/core';

2 import { CommonModule } from '@angular/common';

3 import { CustComponent } from "./cust.component";

4 @NgModule({

5 declarations: [CustComponent],

6 exports:[CustComponent], //CustComponent를 사용하기 위해 export처리함

7 imports: [

8 CommonModule

9 ]

10 })
```

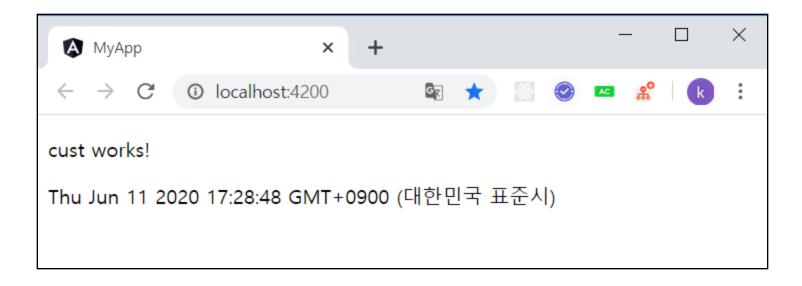

5. Cust 모듈을 app 루트 모듈에 등록한다.

사용자가 정의한 cust.module.ts 파일을 app.module.ts 루트 모듈에 등록한다.

```
app.module.ts X
y-app > src > app > TS app.module.ts > ...
     import { BrowserModule } from '@angular/platform-browser';
     import { NgModule } from '@angular/core';
     import {CustModule} from './cust/cust.module';
     import { AppComponent } from './app.component';
 6
     @NgModule({
       declarations: [
         AppComponent
10
11
       imports: [
12
         BrowserModule.
13
         CustModule
14
15
       providers: [],
       bootstrap: [AppComponent]
16
17
     export class AppModule { }
```

#### 6. 실행

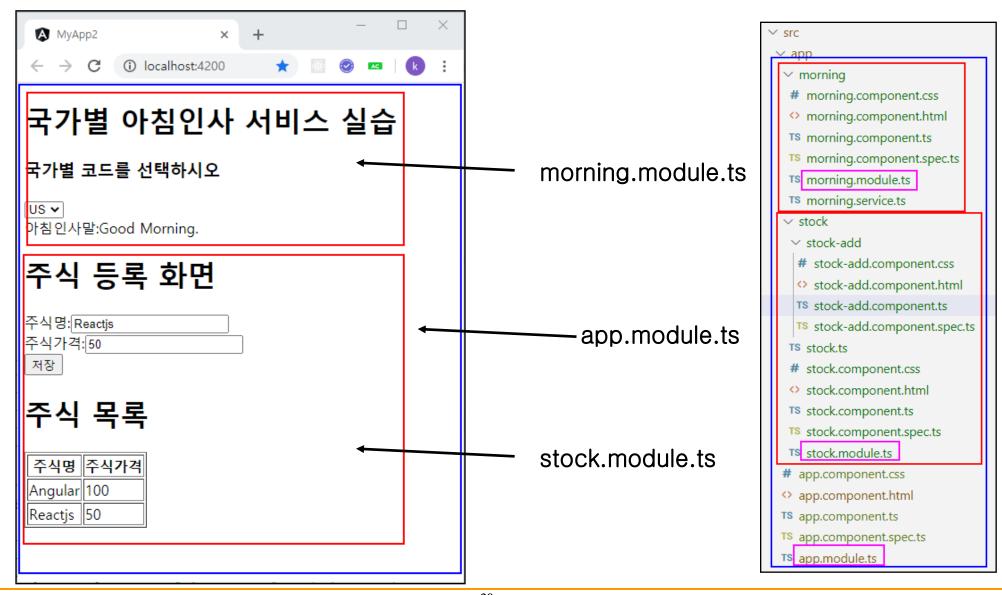

```
